LLMOps 101

Experiment, control costs, and ship LLM apps safely.

PROMPT CHANGES

Prompt A/B testing

Compare prompt versions with real users after offline evaluation.

Keep other settings unchanged.

Record versions and keep a rollback path.

A/B tests compare variants. Canary rollouts check deployment health.

SPENDING

Cost tracking and controls

Measure cost per completed task.

- Split by user, feature, model
- Count retries and supporting calls
- Price input, output, cached tokens
- Cap output, retries, agent steps

Alerts notify. Enforced limits restrict usage.

REUSING INPUT PROCESSING

Prompt caching

Reuse processing of an unchanged prompt prefix across requests.

SAME PREFIX	DIFFERENT QUESTION	GENERATED
Instructions + long product guide	“Is this jacket waterproof?”	New response
Instructions + long product guide	“Does it ship to Canada?”	New response

- Stable content first, changing input last
- Hits can cut input cost and latency
- Rules and pricing vary by provider

Prompt caching reuses input processing.

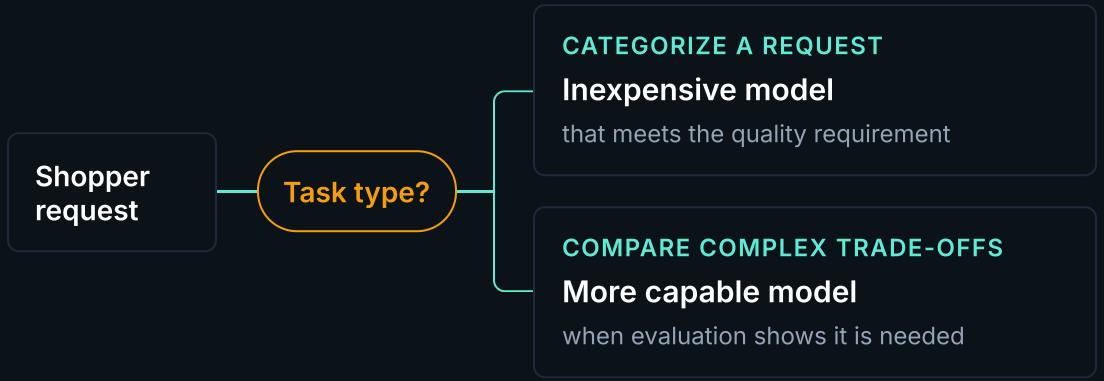

Response caching reuses a previous answer.

MODEL SELECTION

Model routing

Choose a model according to the task's requirements.

Begin with simple task-based rules.

Evaluate every route on its expected workload.

Balance quality, latency, and cost.

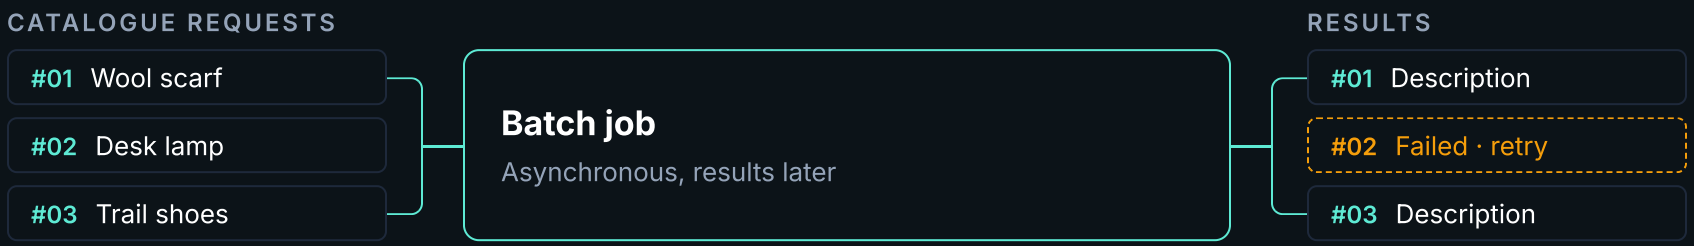

Routing selects a model for the task. Fallback handles a failure.

WORK THAT CAN WAIT

Batch processing

Submit independent requests for asynchronous processing and retrieve results later.

- Use when results can wait
- Match results by request ID
- Retry only failed requests
- Check discount and completion window

A batch holds separate requests, not one combined prompt.

RELEASE READINESS

Pre-production checklist

- ✓ **Quality**
  Representative evals meet defined criteria.
- ✓ **Versioning**
  Prompts and model settings are recorded.
- ✓ **Recovery**
  Rollback and failure handling are tested.
- ✓ **Visibility**
  Quality, errors, latency, and cost are monitored.
- ✓ **Performance**
  Latency targets and expected traffic are checked.
- ✓ **Spending**
  Budgets and usage limits are enforced where needed.
- ✓ **Safety**
  Adversarial cases, permissions, and sensitive data are checked.
- ✓ **Rollout**
  Exposure and rollback conditions are defined.

Caching, routing, and batching are optional optimizations.
